

Microsoft Dynamics - Ax CD

Enterprise
Resource
Planning

Ax CD key elements:

Permits

Tenements

Exploration projects,
budgets, location data

Plod entry and rig
analysis

Samples, QA/QC,
Geology notes

Ax CD key functionality:

PLOD

Tenements

Projects

Drill analysis

Core drilling
parameters

Core drill sectors

Drill hole collars,
types and rigs

What is Ax CD?

Microsoft Dynamics AX is used as the foundation of Ax core drill (CD). Ax CD extends MMP (Mining and Metals Processing) into xMMP (exploration Mining and Metals Processing) and provides users with the ability to manage drilling projects by registering tenements (notification of exploration licenses), plan and budget drilling programs, the logging of large volumes of drill hole data, managing core storage, validating this data, identifying and correcting discrepancies.

Microsoft Dynamics AX in conjunction with Resolve Immix who developed xMMP (Ax CD, Ax SAM, Ax PAM & Ax LIMS) supports the best of breed features and above all is a totally integrated solution (it does not separate the ERP, EAM (maintenance) and production accounting disciplines). The same user interface exists across these modules.

Add to this the Microsoft technology with trusted, scalable and robust platforms and you have a compelling value proposition and cost effective solution. Well integrated information supports reliable and timely information delivery to investors, stakeholders and decision makers.

Why choose Ax CD:

Data security
and integrity

Integrated
with Projects

Integrated
with sample
management

Drilling Reports

Workflow and
device
extension

How can it **support** your business?

Mineral exploration is an intensive, organised and professional form of mineral prospecting. For an exploration-centric operation, basic financials, maintenance, HR and tenement management is a quintessential requirement.

Ax CD allows for the results of the core analysis data to be readily available and is uploaded into a minerals resource model for geo statistical analysis and project valuation. This creates a cross-referenced arm's length model for minerals data integrity.

If you are evolving from a junior exploration company to a full-blown mining operation, you will require a business management system that can cater for tenement accounting, financials and costing in the early stages, then expanding to meet the demands of construction, production reporting, large scale purchasing, HR, asset management and plant maintenance. xMMP offers exactly this and more.

Key **benefits:**

- » Reduces cost
- » Integration with other third-party systems
- » Reduces the risks
- » Provides crucial visibility
- » Scalable
- » Timeliness of results
